PROFESSIONAL SUMMARY

Backend engineer with 10 years building distributed systems and APIs that handle millions of requests daily. I've led architecture decisions for microservices migrations, mentored junior developers, and optimized database performance on systems serving European markets. I enjoy solving hard problems around concurrency and scalability, and I take pride in writing code that's easy to maintain long after I've moved on to the next project.

WORK EXPERIENCE

Staff Backend Engineer

ScanData Systems

<https://scandata.io>

Copenhagen, Denmark

March 2022 - Present

Designed and implemented event-driven architecture supporting 200+ million daily transactions across Nordic region, reducing latency by 40% through careful service decomposition and caching strategies.

Led team of 5 backend engineers through complete rewrite of payment processing system, establishing code review standards and documentation practices that reduced onboarding time for new team members from 4 weeks to 2 weeks.

Owned infrastructure automation using Terraform and Kubernetes, reducing deployment time from 45 minutes to 8 minutes and enabling the team to ship features without waiting for DevOps approval.

Investigated and resolved critical PostgreSQL performance issue affecting customer reporting endpoints, implementing connection pooling and query optimization that reduced p99 latency from 3.2 seconds to 280 milliseconds.

Senior Backend Engineer

TechFlow ApS

<https://techflow.co>

Aarhus, Denmark

June 2018 - February 2022

Built REST and GraphQL APIs serving 15 million requests per day using Go and Node.js, maintaining 99.95% uptime while handling seasonal traffic spikes of 3x normal load during peak periods.

Mentored 3 junior developers through their first major features, conducting detailed code reviews and pairing sessions that helped them grow into mid-level engineers within 18 months.

Migrated monolithic system to microservices architecture over 14 months, coordinating with product and frontend teams to ensure zero disruption to customers while gradually shifting traffic to new services.

Established monitoring and alerting infrastructure using Prometheus and Grafana, creating dashboards that helped teams identify and fix production issues 50% faster than before.

Backend Developer

Netwise Denmark A/S

<https://netwise.dk>

Copenhagen, Denmark

August 2014 - May 2018

Developed backend services for customer management platform used by 2,000+ small businesses, working with Java Spring Framework and MySQL to deliver features on tight quarterly release cycles.

Improved API response times by 35% through indexing strategy improvements and introducing Redis caching layer for frequently accessed customer data.

Participated in on-call rotation, responding to production incidents and implementing fixes within SLAs while documenting root causes to prevent recurrence.

Collaborated with frontend team to design REST API contracts, conducting planning sessions that reduced miscommunication and rework on integration tasks.

EDUCATION

Master of Science in Computer Science

Technical University of Denmark (DTU)

Copenhagen, Denmark

Graduated: June 2014

Thesis: Performance Optimization in Distributed Cache Systems

TECHNICAL SKILLS

Languages: Go, Java, Node.js, Python, SQL

Databases: PostgreSQL, MySQL, MongoDB, Redis

Systems and Tools: Kubernetes, Docker, Terraform, Git, Linux

Architecture: Microservices, Event-Driven Systems, REST APIs, GraphQL

AWS Services: EC2, RDS, S3, Lambda, CloudWatch

Monitoring: Prometheus, Grafana, ELK Stack, Datadog
